-!- FNWCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 C + 2 H(2)0.
--- PATHWAY: Respiratory chain; terminal step.
--- SUBCELLUIAR LOCATION: Integral membrane protein. Mitochondrial inner membrane (8y similarity).
--- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Johnson K.P., Mockford E.L.;

"Extraordinary sex ratios and the evolution of male neoteny in sibmating Ozopemon beetles.";

"Extraordinary sex ratios and the evolution of male neoteny in sibmating Ozopemon beetles.";

Biol. J. Linn. Soc. Lond. 75:353-360(2002).

-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and copper B (By similarity).

--- CATANTYIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)0.

--- PATHWAY: Respiratory chain; terminal step.
--- SUBGEBLULLAR LOCATION: Integral membrane protein. Mitochondrial inner membrane (By similarity).
--- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                               FUNCTION: Cytochrome coxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and home A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)O.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inner membrane (By similarity).
-!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.

Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Blectrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and copper B (By similarity).

Nematology 4:759-771/2002).
-!-FUNCTION: Cytochrome c oxidase is the component of the respiratory of a formathe functional core of the enzyme complex. Co is the catalytic subunit of the enzyme complex. Co is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                  inner membrane (By similarity).
-!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.

Psacothea hilaris (Coleoppera: Cerambycidae).";
Nematology 4:759-771(2002).
-!-FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Blectrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
-!-CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inner membrane (By similarity).
-!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.

                                                                                     -!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Blectrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B [By similarity).
-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Psacothea hilaris (Coleoptera: Cerambycidae).";

0
3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nematology 4:759-771(2002).

Nematology 4:759-771(2002).

-!-FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO i is the catalytic subunit of the enzyme. Blectrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

-!-CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)O.
                                                                                                                                                                                             -!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + 0(2) = 4 ferricytochrome

FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inner membrane (By similarity).
-!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  c + 2 H(2)0.
-!- PATHWAY: Respiratory chain; terminal step.
-!- SUBCELLULAR LOCATION: Integral membrane protein. Mitochondrial

Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in exprodirem c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CATALYTIC ACTIVITY: 4 ferrocytochrome c + 0(2) = 4 ferricytochrome

```

```
C + 2 H(2) C.

C - 1- PATHWAY: Respiratory chain; terminal step.

C - 1- SUBLELOLAR LOCATION: Integral membrane protein. Mitochondrial inner membrane (By similarity).

C - 1- SIMILARITY: Belongs to the heme-copper respiratory oxidase family. BEBL; AB08175: BAC44559: 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -I-FUNCTION: Cytochrome coxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and copper B (By similarity).

CATALYIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Paracthea hilaris (Coleoptera: premarcula: principality and Psacothea hilaris (Coleoptera: Cerambycidae).";
Nematology 4:759-771(2002).
-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3
                                                                                                                                                                                                                                                                                                                                                                                                                                        per B (By similarity).   
IC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    inner membrane (By similarity).
-!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CHARTY IN CALCIDION COXIDAGE is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-
3 form the functional core of the enzyme complex. Co I is the
catalytic subunit of the enzyme. Blectrons originating in
cytochrome c are transferred via the copper A center of subunit 2
and home A of subunit 1 to the bimetallic center formed by heme A3
and copper B (By similarity).
CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PATHWAY: Respiratory chain; terminal step.
SUBCELLULAR LOCATION: Integral membrane protein. Mitochondrial
Inner membrane (By similarity).
SIMILARITY: Belongs to the heme-copper respiratory oxidase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Membrane;

chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
                                                                                                      and copper B (By similarity). CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                     PATHWAY: Respiratory chain, terminal step.
SUBCELLULAR LOCATION: Integral membrane protein. Mitochondrial inner membrane (By similarity).
SIMILARITY: Belongs to the heme-copper respiratory oxidase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

-!- CATALYIIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)0.

-!- PATHWAY: Respiratory chain; terminal step.
-!- SUBCELLULAR LOCATION: Integral membrane protein. Mitochondrial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family. Abn. 61:3-67/2003.

-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Co I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                  Klass K.-D., Picker M.D., Damgaard J., van Noort S., Tojo K.;

```
Probably responsible for the translocation of the substrate across the membrane (By similarity).
-!- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).
-!- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).
-!- SUBCELLULAR Selongs to the binding-protein-dependent transport system permease family.
--- SIMILARITY: Belongs to the binding-protein-dependent transport system permease family.

Extraordinary sex ratios and the evolution of male neoteny in sibmatraordinary sex ratios and the evolution of male neoteny in sibmatrial Ozopemon beetles.";

Biol. J. Linn. Soc. Lond. 75:353-360(2002).

-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

-!- GATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2) = C + 2 H(2) 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                             -!- FUNCTION: Cytochrome coxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Co I is the catalytic subunit of the enzyme. Bleckrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mating Ozopemon beetles.";

                                                                                                                                                                                         c + 2 H(2)0.
PATHWAY: Respiratory chain, terminal step.
SUBCELLUIAR LOCATION: Integral membrane protein. Mitochondrial inner membrane (By similarity).
SIMILARITY: Belongs to the heme-copper respiratory oxidase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

-!-FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxegen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Blectrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

-!-CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -!- PATHWAY: Respiratory chain; terminal step.
-!- SUBCELLULAR LOCATION: Integral membrane protein. Mitochondrial inner membrane (By similarity).
-!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.
EMBL; AF438519; AAM08283.1; -.
cytocorrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

"Extraordinary sex ratios and the evolution of male neoteny in sib-
mating Ozopenon beetles.",

Biol. J. Linn. Soc. Lond. 75:353-360(2002).

-I-FUNCTION: Cytochrome c oxidase is the component of the respiratory
chain that catalyzes the reduction of oxygen to water. Subunits 1-
3 form the functional core of the enzyme complex. CO I is the
catalytic subunit of the enzyme. Blectrons originating in
cytochrome c are transferred via the copper A center of subunit 2
and heme A of subunit 1 to the bimetallic center formed by heme A3
and copper B (By similarity).

-I-CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Biol. J. Linn. Soc. Lond. 75:353-360(2002).

Biol. V. Linn. Soc. Lond. Oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Blectrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    inner membrane (By similarity).
-!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.

Biol. J. Linn. Soc. Lond. 75:353-360(2002).

"EVALVACION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

--- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Cerambycidae, Laminae, Acanthocinini) on assessments of host, seasonal, and stratum specificity.";
Biol. J. Linn. Soc. Lond. 76:195-209(2002).
-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Rlectrons oxiginating in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota, Fungi, Ascomycota, Pezizomycotina, Eurotiomycetes,

Submitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme complex. CO I is the cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           inner membrane (By similarity).
-!-SIMILARITY: Belongs to the heme-copper respiratory oxidase family.

CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                    inner membrane (By similarity).
-!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.

Biol. J. Linn. Soc. Lond. 76:195-209(2002)
-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Bectrons originating in cytochrome c are transferred via the copper A center of subunit 2
chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Blectrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
                                                           and copper B (By similarity).

CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)0.
                                                                                                                                     inner membrane (By similarity).
-!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

-! FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Blectrons originating in catalytic subunit of the enzyme is lectrons originating in cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and copper B (By similarity). CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
  cytochrome c are transferred via the copper A center of subunit 2 and heme A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                 inner membrane (By similarity).
SIMILARITY: Belongs to the heme-copper respiratory oxidase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   c + 2 H(2)0.
PATHWAY: Respiratory chain; terminal step.

-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Submits 1-3 form the functional core of the enzyme complex. CO I is the catalytic submit of the enzyme. Blectrons originating in cytochrome c are transferred via the copper A center of submit 2 and heme A of submit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome

-!-FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. CO I is the catalytic subunit of the enzyme. Electrons originating in cytochrome c are transferred via the copper A center of subunit 2 and home A of subunit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

Normark B.B., Jordal B.H., Farrell B.D.; DBJ databases.

Submitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.

Submitted (SEP-1999) to still as the component of the respiratory chain that catalyzes the reduction of oxygen to water. Submits 1-3 form the functional core of the enzyme complex. CO i is the catalytic subunit cost of the enzyme complex. CO i is the catalytic subunit conference of the enzyme comper A center of subunit 2 and heme A of submit 1 to the bimetallic center formed by heme A3 and copper B (By similarity).

-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)O.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- PATHWAY: Respiratory chain; terminal step.
-!- SUBCELLULAR LOCATION: Integral membrane protein. Mitochondrial inner membrane (By similarity).
-!- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAR89340-R89351 are Cdk-2 interacting peptides identified by an interaction trap assay using conformationally-constrained proteins. The assay comprises providing a host cell (esp. a yeast cell) which contains: (i) a reporter gene operably linked to a DNA-binding protein recognition site, pref. LexA, (ii) a 1st fusion gene expressing Cdk-2 covalently bonded to a LexA binding protein, and (iii) a 2nd fusion gene expressing a conformationally-constrained (pref. with thioredoxin) protein (either expected to interact with Cdk-2 or a random peptide) covalently bonded to a gene-activating moiety, and measuring expression of the reporter gene as a measure of interaction between Cdk2 and the conformationally constrained protein. The same system may be applied to find proteins that interact with any other protein of interactions agonist or antagonist activity on such interactions

Aptamers AAW32116-W32132 have been isolated from a peptide library and are used in a novel interaction trap method for detecting protein interactions and isolating novel proteins. The method involves a host cell containing a reporter gene operably linked to a DNA-binding-protein (DBP) recognition site, a fusion gene capable of expressing a fusion protein which is able to specifically bind to the DBP recognition site and a second fusion gene which expresses a second fusion protein which is onformationally constrained and bonded to a gene activating moiety. Measuring expression of the reporter gene gives a measure of the interaction between Pl and P2. This method can be used to identify agonists or antagonists for use as therapeutic molecules or for the cissing of simple molecule mimetics. The method is specifically used to detect an interacting protein in a population of proteins or to identify a candidate interactor. Using conformationally constrained proteins can provide for terriary structural analysis and can also protect proteins from cellular degradation and/or increase the protein's solubility, and/or otherwise alter the capacity of the candidate interactor to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ·;
                                                                                                                                                                                                                                                                                                                                                                                                                         New trap system for detecting protein interactions - comprises a reporter gene linked to a DNA-binding-protein recognition site and fusion proteins to test for interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The process involves the introduction into the cell of chimeric molecule known as a targeted effector, comprising a recognition moiety capable of recognising T and an effector moiety. The chimeric protein or nucleic acid can be used in the preparation of a medicament for the treatment of microbial infections, immunological disorders, metabolic disorders, psychiatric disorders, myopathies, genetic disorders, cancer, cardiovascular disorders and dental disorders. The present sequence is a mutant of a known anti-Cdk2 aptamer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Intracellular target; cellular component; property modulation; antimicrobial; immunomodulatory; nootropic; neuroprotective; metabolic; neuroleptic; cytostatic; cardiant; infection; immunological disorder; neurological disorder; metabolic disorder; psychiatric disorder; myopathy; cancer; cardiovascular disorder.
                                                                                                                                                            Process for specifically modulating the properties of an intracellular target molecule used for the treatment of various disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Process for specifically modulating the properties of an intracellular target molecule used for the treatment of various disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Intracellular target molecule property modulation method aptamer 10.

The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
           The present invention relates to a process for specifically modulating the properties of an intracellular target molecule T, and/or of a cellular component C which interacts directly or indirectly in a cell with the target. The process involves the introduction into the cell of chimeric molecule known as a targeted effector, comprising a recognition moiety capable of recognising T and an effector moiety. The chimeric protein or nucleic acid can be used in the preparation of a medicament for the treatment of microbial infections, immunological disorders, myopathies, genetic disorders, metabolic disorders, psychiatric disorders, myopathies, genetic disorders and dental disorders. The present sequence is a known anti-Cdk2 aptamer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bacterial infection; Pseudomonas aeruginosa infection; antibacterial.

Specifically, it refers to peptides derived from the small heat shock protein 20 (HSP20), a protein that is highly and constitutively expressed in muscle tissue. Furthermore, an increased phosphorylation of HSP20 is associated with the cyclic nucleotide-dependent relaxation of vascular smooth muscle, and increasing the contractile rate in heart muscle must also comprise decreasing the heart muscle relaxation rate. The present invention describes peptides and methods to treat cardiac disorders including bradyarrhythmia, bradycardia, congestive heart failure, stunned myocarchim, pulmonary hypertension and diastolic dysfunction. In addition, it can be useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                      human, contractile rate; heart muscle; heat shock protein 20; HSP20; cardiac disorder; bradyarrhythmia; bradyardia; congestive heart failure; stunned myocardium; pulmonary hypertension; disortolic dysfunction; hypertension; anaemia; hyperthyroidism; pulmonary stenosis; protein therapy; antiarrhythmic; cardiant; hypotensive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Increasing the contractile rate in heart muscle, useful for treating e.g., congestive heart failure, heart muscle failure, pulmonary hypertension or bradyarrhythmia, comprises administering one or more heat
polypeptides of the invention. Note: The
                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                       Phosphoserine peptide analogue derived from HSP20 protein SegID 299.
                  sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html

         example, hypertension, anaemia, hyperthyroidism and pulmonary stenosis. Accordingly, these compositions can be used for protein therapy and sexhibit antiarrhythmic, cardiant and hypotensive activities. This peptide sequence is a phosphoserine peptide analogue derived from the human HSP20 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel polypeptide comprising a heat shock protein 20-derived polypeptide. A polypeptide of the invention has cytostatic, antiarteriosclerotic, vasotropic, antianginal, cerebroprotective, antiarrhyhmic, antiasthmatic, gynaecological, hypotensive, antimigraine, tocolytic, and relaxant activity, and may act as a HSP agonist or antegonist. The polypeptides, heat shock protein (HSP) 20, and methods are useful for treating or preventing a disorder, e.g. intimal hyperplasia, stenosis, restenosis, transplant vasculopathy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New heat shock protein 20-derived polypeptides, useful for inhibiting, treating or preventing smooth muscle cell vasospasm or a disorder such intimal hyperplasia, restenosis, atherosclerosis or smooth muscle cell

atherosclerosis, smooth muscle cell tumours such as leiomyosarcoma, ovasospasm, which is associated with angina, coronary vasospasm, Prinzmetal's angina, coronary ischaemia, stroke, bradycardia, hypertension, pulmonary (lung) hypertension, asthma (bronchospasm), toxemia of pregnancy, pre-term labour, pre-eclampsia/eclampsia, Raynaud's disease, Raynaud's phenomenon, haemolytic-uremia, non-occlusive mesenteric ischaemia, anal fissure, achaliasia, impocence, migraine, or ischaemic muscle injury associated with smooth muscle spasm. The polypeptides and HSP 20 are also useful for inhibiting smooth muscle cell broliferation and/or migration. The present sequence represents a peptide used in a polypeptide of the invention.

                    hypotensive, antimigratine, trocolytic, and relaxant activity, and may act as a HSP agonist or antagonist. The polypeptides, heat shock protein (HSP) 20, and metchods are useful for treating or preventing a disorder, e.g. intimal hyperplasia, stenosis, restenosis, transplant vasculopathy, attherosclerosis, semoch muscle cell tumours such as leiomyosarcoma, or vasospasm, which is associated with angina, coronary vasospasm, prinzmetal's angina, coronary ischaemia, stroke, bradycardia, hypertension, pulmonary (lung) hypertension, asthma (bronchospasm), toxemia of pregnancy, pre-term labour, pre-eclampsia/eclampsia, Raynaud's disease, Raynaud's stroke, and processed to the strong coronary in the modition of the strong coronary is a stroke, and a stroke colusive and the strong coronary is a stroke, and a stroke colusive and the strong coronary is a stroke colusive and column 
                                                                                                                                                                                                                                                                                                                   mesenteric ischaemia, anal fissure, achalasia, impotence, migraine, or ischaemic muscle injury associated with smooth muscle spasm. The polypeptides and HSP 20 are also useful for inhibiting smooth muscle cell
                                                                                                                                                                                                                                                                                                                                                                                                       iferation and/or migration. The present sequence represents a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypethysoidism; cholesterol ester storage disease; immune deficiency; immune disorder; inflectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;

```

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1

```
treating given in ABPRONIC to ABPRILEGO. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, near the transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disorders mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid airsease autoimmune thyroidistis, mysethenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0,
                                                                                                                                                                                                                                                                               useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      polypeptide designated ORFX are present in human atherogenic cells are useful to prevent and treat ORFX-associated disorders including

                                                                                                                                                        The present invention relates to novel human ORFX polypeptides and their coding sequences (ABP63631-ABP64681 and ABQ98194-ABG99267). The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HUVEC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, blood for this patent did not form part of the printed specification, but was sequate uspto.gov/sequence.html?DocID=20020082206
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a prophylaxis and treatment of pathological conditions resulting from a prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bacterial infection; Pseudomonas aeruginosa infection; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-Sequence represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polynocleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences ABO4302 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed appearance may be a peruginosa polypeptides of the invention. Note: The specification but was obtained in electronic format from USPTO at

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a barcherial infection, for evaluating a compound, such as a polypeptide, or for the ability to bind a P. aeruginosa mucleic acid, as components of effective antibacterial targets, as templates for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant or production of P. aeruginosa drugs, as templates for recombinant of P. aeruginosa sequences or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa sequences of Pseudomonas species using biochip technology. Sequences ABO67826-Capacidication and in detection of P. aeruginosa sequences ABO67826-Capacidication but was obtained in electronic format from USPTO at sequence. ABO8436 represent P. aeruginosa polypeptides of the printed specification but was obtained in electronic format from USPTO at sequence. ABO8436 represent P. seruginosa polypeptides of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Central nervous system, CNS; autoimmune disease, rheumatoid arthritis; hyperproliferative disorder; neoplasm; cardiovascular disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hyperthermophile Methanopyrus kandleri, the invention also comprises the complete genome from Methanopyrus kandleri. The Methanopyrus kandleri proteins of the invention are useful for enhancing the stability and/or activity of other proteins. The Methanopyrus kandleri genome is useful in a variety of diagnostic and analytical methods. The present amino acid sequence represents a Methanopyrus kandleri protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acids encoding any of about 1700 Methanopyrus kandleri proteins, and the encoded proteins, useful as a medicaments or as diagnostic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                         The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded by (I), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative clasorders e.g. neoplasms of the breast or liver, cardiovascular disorders c.g. cardiac arrest, cerebrovascular disorders e.g. crebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease and amylotrophic lateral sclerosis, infections caused by bacteria, viruses c.g. Acquired immunodeficiency virus (AIDS) and fungi, ocular disorders e.g. testicular feminisation, reproductive system disorders e.g. testicular feminisation, endocrine disorders e.g. diabetes and pituitary dwarfism, cancers and disorders at the cellular level e.g. and pituitary dwarfism, cancers and disorders at the cellular level e.g. respiratory disorders e.g. nonallergic rhinitis, renal disorders e.g. caute kidney failure and blood related disorders e.g. mylocardial continental cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues to regenerate tissues and in chemorasis. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes an isolated polypeptide comprising an amino acid sequence at least 90% identical to: a polypeptide fragment, domain, epitope, or full-length protein of any one of 60% amino acid sequences (I) described in the specification, a polypeptide fragment of (I), or the encoded sequence contained in (II), having biological activity; or a variant, allelic variant, or a species homologue of (I). The polypeptides and nucleic acid molecules are useful for detecting, preventing, diagnosing, prognosticating, treating or ameliorating medical conditions with a neural disorders, e.g. Alzhaimer's disease, Parkinson's disease, Huntington's chorea, amyotrophic lateral sclerosis or multiple sclerosis, immune system disorders, e.g. diabetes, rheumatoid arthritis, systemic

This invention relates to novel isolated human polynucleotides and the encoded proteins thereof. Specifically, it refers to proteases, kinases, phosphatases, secreted and transmembrane proteins, as well as the derived peptide fragments, which can be used to develop antibodies and screen for small molecule agonists and antagonists that can modulate their activities. The present invention describes polypeptides, polymbolecides, vectors and nate calls useful for diagnosing, preventing and treating proliferative disorders, e.g. cancer, disorders of the mematopoiesis such as thrombosis and natemia, cardiovascular disorders, e.g. ischaemic heart disease and anemia, cardiovascular disorders, e.g. ischaemic heart disease and anemia, cardiovascular disorders, e.g. extrointestinal disorders, e.g. chronic renal failure and glomerulopathy, gastrointestinal disorders, e.g. chronic renal failure and glomerulopathy, disorders, e.g. HIV infection and systemic lupus erythematosus, disorders disorders, e.g. diabetes mellitus, central nervous system disorders, e.g. poptic ulcer or cirrhosis, immune construction, expirations and system disorders, e.g. provinces mellitus, central nervous system disorders, e.g. postiasis, as well as bacterial, fungal, parasitic and viral diseases. Accordingly, they exhibit many various activities including cytostatic, anticoagulant, thrombolytic, anticoadulant, cardiant, vascironic immatory, contractive contractions and cardiant contractions disconders, e.g. entital diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nephrotropic, antiulcer, hepatotropic, immunosuppressive, antiallergic, defamatological, antirheumatic, antiathritic, antidiabetic, anticonvulsant, neuroprotective, noorropic, antipsoriatic, antibacterial, fungicide, antiparasitic and virucidal, such that these polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       can be used for gene therapy purposes and the development of appropriate vaccines. This polypeptide is a human protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human polynucleotides and polypeptides, useful for diagnosing, preventing and treating proliferative disorders, immune disorders, cardiovascular disorders, or bacterial, fungal, parasitic and viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; SEQ ID NO 348; 254pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for screening G protein-coupled receptor (GPCR) genes (ABZ42870-ABZ43216) and/or GPCR proteins (ABB95596-ABB95942) by extracting open-reading frames containing 6-8 transmembrane domains with 250-1000 amino acid residues to give a gene homologous with a known GPCR gene. The receptor proteins and encoded genes are useful for studying in vivo signal transduction mechanism and identifying targets for drug development e.g. based on olfactory and gustatory receptors in form of agonists and antagonists by screening intrinsic and extrinsic improvers. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a new isolated nucleic acid encoding a Klebsiella
                                                                                                                                                                                                                                                                                                                                                                                                                                       pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regularory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Zyskind JW;

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of movel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, consectul for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify correct or proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acids sequence is also useful to screen for homologous culcier acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.
                                                                                                                                                                                                                                New polynucleotides for the identification and development of antibiotics, comprise sequences of antisense nucleic acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             \delta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Op
                                              the invention traders to an institute and any other of the nucleic acid inhibits proliferation of a cell. Also included are:

the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense contisense mucleic acid; (2) a host cell containing the vector; (3) an isolated contisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway contained for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an equired for proliferation or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sactivity; (11) a culture comprising strains in which the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling a compound strains; or (13) identifying the target of a compound that inhibits the extent or organism; or (13) identifying the target of a compound that inhibits the compound section of an organism; or (13) identifying the target of a compound that inhibits or compound that inhibits or compound that inhibits or compound that inhibits or compound the compound that inhibits the compound compound that inhibits or compound the compound that inhibits or compound that inhibits or co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                 The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense, prokaryotic cellular proliferation protein, antibiotic, antibacterial; drug design.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in fissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in responsible for generic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic manno acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPPO at
New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

New nucleic acid comprising a sequence encoding an Enterococcus fecalis

```
polypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector comprising the nucleic acid and a cell comprising the recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Entercoccocus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                              The invention relates to Enterococcus faecalis polynucleotides and
  or
polypeptide, useful for preparing a composition for diagnosing treating E. fecalis infection.

Disclosure; SEQ ID NO 17629; 455pp; English.

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target

This is the amino acid sequence of the product of the spnO gene. The protein is involved in spinosyn biosynthesis. The SpnO gene is one of 23 genes and open reading frames contained in an 80kb DNA sequence AAZ21501. Spinosyns are insecticidal microlides which are useful for the control of arachnids, nematodes and insects. Biosynthesis of spinosyns occurs via stepwise condensation and modification of carboxylic acid precursors generating a linear polyketide which is modified further. The DNA sequence contains a central region of approximately 55kb which has homology to the DNA encoding the polyketide synthases (PKS) of known macrolide producers. The spinosyn PKS DNA region consists of 5 ORFs with stop codons at the end of acyl carrier protein (ACP) domains. Together the PKS polypeptides (AAY3929-Y39301), form a complex consisting of an initiator module, sppA, and several extender modules spnB-spnE. The cintiator module, spnA, and several extender modules spnB-spnE. The products of the genes present in the region upstream of the PKS genes have been assigned names spnF-spnS AAX3302-Y39315 and are responsible considered that GPR-139317, and two ORFS ORFI and ORFL16 present immediately upstream of spnS, producing colypeptides AAY39316-Y39317, and two ORFS ORFI and ORFL16 present immediately upstream of spnS, producing spinosyn biosynthesis. The genes are useful to improve yields of spinosyns, and for creating new spinosyns e.g. by mutagenesis, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; Page 159-161; 190pp; English.

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as polypeptide, or the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant or production of P. aeruginosa derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa sequences or cother sequences of Pseudomonas species using biochip technology. Sequences AB067826-CTC AB084396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed sequence. The sequence data for this patent did not form part of the printed sequence. The sequence them

This invention describes a novel method muches acid (1) and its encoded activity involved in biosynthesis of spinosyns. (1) are used (1) to activity involved in biosynthesis of spinosyns. (1) are used (1) to identify, inactivate or medulate genes involved in the biosynthesis of identify, inactivate or medulate genes involved in the biosynthesis of adding forosamine or trimethylthamnose to a spinosyn or polyketide adding forosamine or trimethylthamnose to a spinosyn or polyketide aglycone, and (1) for recombinant production of the corresponding anymes, which are used for production of (11), their precursors or derivatives, including production of transgenic plants that express (11) and thus have increased resistance to insects. (1) are also useful as markers for sequencing of the Saccharopolyspora spinosa genome. (11) are macrolides with insecticidal, but not antibacterial, activity, and can also be used to raise specific antibodies, useful for identifying also be used to raise specific antibodies useful for identifying cypression clones in a gene bank. Cells transformed with (1) may produce (11) at significantly increased levels or produce new derivatives of (11). This sequence represents an S. spinosa 2,3-dehydratase
interruption of steps in spinosyn biosynthesis. The modified spinosyns may be a new insect control agent or serve as substrates for further chemical modification and the creation of new semi-synthetic spinosyns. The genes are also useful to isolate similar sequences from S. spinosa or other species by hybridization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method nucleic acid (I) and its encoded

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel DNA molecule comprising a DNA sequence that encodes a butenyl-spinosyn biosynthetic enzyme, a butenyl-spinosyn PKS (polyketide synthetase) domain, or a spinosyn PKS module. The butenyl-spinosyn biosynthetic genes are useful for increasing the production of butenyl-spinosyn insecticidal macrolides. The genes are also useful for an engage the metabolites or produces produced by spinosyn-producing microorganisms. The present sequence represents one of the butenyl-spinosyn biosynthetic polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New butenyl-spinosyn biosynthetic genes, useful for increasing the production of butenyl-spinosyn insecticidal macrolides, or for changing the metabolites or products produced by spinosyn-producing

The present invention relates to a method of producing a transformed plant that selectively increases production of gamma-aminobutryic acid (GABA) in response to a signal, by incorporating into the plant's genome a DNA construct with a non-constitutive promoter operably linked to a polynucleotide encoding a functional plant glutamic acid decarboxylase (GAB), to provide a transformed plant texpresses the GAB coding sequence in response to a signal, Plants of this type have an enhanced
                                                                                                                                                                                                  invention relates to identifying target proteins (ABB90790-ABB94016)
                                                                                                                                                                                                                  for herbicidally active compounds, comprising aligning and comparing muclaic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from plant organisms using suitable search parameters, where plant sequences having an B-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Making transformed plants that selectively increase gamma-aminobutyric acid production, by incorporating a DNA construct with a polynucleotide encoding a plant glutamic acid decarboxylase enzyme into plant's genome.
                                      Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GAD; plant GABA production regulation; glutamic acid decarboxylase; plant stress; GABA; gamma-aminobutyric acid; stress resistance.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element, and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nseful for

The invention also comprises the nuclectide sequence of the picric acid degradation gene cluster containing all 12 of the ORFs. The picric acid degradation pathway genes and enzymes of the invention are useful for creating recombinant organisms that have the ability to degrade picric acid. As well as for the identification of new species of bacteria that have the ability to degrade picric acid. The present amino acid sequence represents a fer the degrade picric acid. The present amino acid sequence represents a fer encourage of the contains and the present and degradation pathway-related
                                                                                                                                                                                                                                                                                                                                                             Rhodococcus picric acid degradation pathway-related transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        40

The polynucleotide sequences of the invention are useful for creating recombinant organisms that have the ability to degrade picric acid. Picric acid which is used in industrial applications including the manufacture of explosives, aniline, colour fast dyes, pharmaccuticals and in steel etching, is highly unstable. The present invention provides a means of disposal/removal of this toxic substance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           from the environment by an enzymatic degradative process. The present sequence represents a transcription factor encoded by picric acid degradation gene cluster ORFI. (Updated on 29-AUG-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Picric acid degradation; 2,4,6-trinitrophenol; explosive manufacturing; aniline; colour fast dye; pharmaceutical; steel etching; environmental toxicant; enzymatic degradative process;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid encoding an F420/NADPH oxidoreductase isolated from Rhodococcus erythropolis HL PM-1 is associated with picric acid degradation and is useful to create recombinant organisms that degrade.

The invention relates to a reliable and rapid method to identify differentially expressed genes in microbes. The method relies on the use differentially expressed genes in microbes. The method rise cof a large number of arbitrarily primed PCR reactions. The method is useful for identifying differentially expressed genes in microbes, and for distinguishing genetic differences between two populations of cells which differ in genotype. This method is useful for identifying the DNA sequences of genes involved in the degradation of the picric acid from Rhodococcus expthropolis strain HL PM-1, and genes involved in cyclohexanol degradation from a consortium of organisms, or to detect of a reample of the inhibitory effects of various treatments such as chemicals, environmental pollutants, heavy metals, changes in the emperature, changes in pH, agents producing oxidative damage, agents producing DNA damage, anaerobiosis, pathogenesis, and changes in nitrate availability on mRNA levels. The present sequence is a transcription factor encoded by Rhodococcus erythropolis strain HL PM-1 picric acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying differentially expressed genes, by amplifying total RNA of first microbial cell population that is contacted with stimulating agent and of a second population using arbitrary primers, and comparing them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence is a human OCTIP (organic cation transporter-like protein), a member of the superfamily of sugar and other transporter molecules that have 12 transmembrane domains. The sequence is derived from a human foetal brain cDNA library. The protein is highly expressed in brain tissue and has nootropic, neuroprotective, neuroleptic, anticonvulsant, antiParkinsonian, antidepressant activities. The present sequence is used to regulate a variety of cellular processes e.g. cell proliferation, differentiation and survival, screen octip modulators and detect mutation in OCTIP gene. OCTIP modulators can be used to treat or prevent chronic neurodegenerative disorders (e.g. Alzheimer's, Parkinson's, Huntington's and ALS), CNS disorders (e.g. schizophrenia, panic, depression), behavioural, sleep and eating disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid encoding human organic cation transporter-like protein, used for prevention, treatment and diagnosis of e.g. neurological, behavioral or sleep disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .,

The method involves administering a modulator of 577 (also known as sodium dependent proline transporter), 20739 (also known as P21-activated kinase 3 (PAK-3)) or 5745 (also known as OCT-5). The 577, 20739 or 57045 modulator is useful for treating pain disorders like inflammatory pain, chronic pain, neuropathic pain, causalgia, fibromyalgia, cancer pain, migraine/headache pain and tissue pain. The invention also describes methods for diagnosis and prognesis of various cardiovascular disorders, and for identification of subjects exhibiting a predisposition to such conditions. The present sequence is human 57145 protein
                                                                                                                                                                                                                                                                                                                             Treating a subject having a pain disorder characterized by aberrant 577, 20739 or 57145 polypeptide activity or nucleic acid expression, e.g. cancer pain or inflammatory pain, comprises administering a 577, 20739 or
